Welcome!

Digital archaeology as a field rests upon the creative use of primarily open-source and/or open-access materials to archive, reuse, visualize, analyze and communicate archaeological data. This reliance on open-source and open-access is a political stance that emerges in opposition to archaeology's past complicity in colonial enterprises and scholarship; digital archaeology resists the digital neo-colonialism of Google, Facebook, and similar tech giants that typically promote disciplinary silos and closed data repositories. Specifically, digital archaeology encourages innovative, reflective, and critical use of open access data and the development of digital tools that facilitate linkages and analysis across varied digital sources.

To that end, this document you are reading is integrated with a cloud-based digital exploratory laboratory of multiple cloud-computing tools with teaching materials that instructors will be able to use 'out-of-the-box' with a single click, or to remix as circumstances dictate. Part of our inspiration comes from the 'DHBox' project from CUNY (City University of New York, [link](#)), a project that is creating a 'digital humanities laboratory' in the cloud. While the tools of the digital humanities are congruent with those of digital archaeology, they are typically configured to work with texts rather than material culture in which archaeologists specialise. The second inspiration is the open-access guide 'The Programming Historian', which is a series of how-tos and tutorials ([link](#)) pitched at historians confronting digital sources for the first time. A key challenge scholars face in carrying out novel digital analysis is how to install or configure software; each 'Programming Historian' tutorial therefore explains in length and in detail how to configure software. The present e-textbook merges the best of both approaches to create a singular experience for instructors and students: a one-click digital laboratory approach, where installation of materials is not an issue, and with carefully designed tutorials and lessons on theory and practice in digital archaeology.

Chapter 1

Going Digital

Digital archaeology should exist to assist us in the performance of archaeology as a whole. It should not be a secret knowledge, nor a distinct school of thought, but rather simply seen as archaeology done well, using all of the tools available to and in better recovering, understanding and presenting the past. In the end, there is no such thing as digital archaeology. What exists, or at least what should exist, are intelligent and practical ways of applying the use of computers to archaeology that better enable us to pursue both our theoretical questions and our methodological applications. (Evans and Daly 2006)

While we agree with the first part of the sentiment, the second part is rather up for debate. Digital tools exist in a meshwork of legal and cultural obligations, and moreso than any other tool humans have yet come up with, have the capability to exert their own agency upon the user. Digital tools and their use are not theory-free or without theoretical implications. There is no such thing as neutral, when digital tools are employed.

In this section, we suggest that digital archaeology is akin to work at the intersection of art and public archaeology and digital humanities. We then provide you the necessary basics for setting up your own digital archaeological practice.

1.1 So what is Digital Archaeology?

If you are holding this book in your hands, via a device or on paper, or looking at it on your desktop, you might wonder why we feel it necessary to even ask the question. It is important at the outset to make the argument that digital archaeology is not about ‘mere’ tool use. Andrew Goldstone in *Debates in the Digital Humanities* discusses this tension (Goldstone 2018). He has found (and Lincoln Mullen concurs with regard to his own teaching, (Mullen 2017)) that our current optimism about teaching technical facility is misplaced. Tools first, context second doesn’t work. Alternatively, theory first doesn’t seem to work either. And finally, for anything to work at all, datasets have to be curated and carefully pruned for their pedagogical value. We can’t simply turn students loose on a dataset (or worse, ask them to build their own) and expect ‘learning’ to happen.

Our approach in this volume is to resolve that seeming paradox by providing not just the tools, and not just the data, but also the computer itself. Archaeologically, this puts our volume in dialog with the work of scholars such as Ben Marwick, who makes available with his research the code, the dependencies, and sometimes, an entire virtual machine, to enable other scholars to replicate, reuse, or dispute his conclusions. We want you to reuse our code, to study it, and to improve upon it. We want you to annotate our pages, and point out our errors. For us, digital archaeology is not the mere use of computational tools to answer archaeological questions. Rather, it is to enable the audience for archaeological thinking to enter into conversation with us, and to *do* archaeology for themselves.

Digital archaeology is necessarily a public archaeology. This is its principal difference with what has come before, for never forget, there has been at least a half-century of innovative use of computational power for archaeological knowledge building.

1.1.1 Is digital archaeology part of the digital humanities?

The Computer Applications in Archaeology Conference has been publishing its proceedings since 1973. Archaeologists have been running simulations, doing spatial analysis, clustering, imaging, geophysicing, 3d modeling, neutron activation analyzing, x-tent modeling , etc, for what seems like ages.

Surely, then, digital archaeologists are digital humanists too? Trevor Owens, a digital archivist, draws attention to the purpose behind one’s use of computational power – generative discovery versus justification of an hypothesis (Owens, Trevor 2012). Discovery marks out the digital humanist whilst justification signals the humanist who uses computers. Discovery and justification are critically different concepts. For Owens, if we are using computational power to deform our texts, then we are trying to see things in a new light, to create new juxtapositions, to spark new insight. Stephen Ramsay talks about this too in *Reading Machines* (Ramsay 2011, 33), discussing the work of Samuels and McGann, (Samuels and McGann 1999): “Reading a poem backward is like viewing the face of a watch sideways – a way of unleashing the potentialities that altered perspectives may reveal”. This kind of reading of data (especially, but not necessarily, through digital manipulation), does not happen very much at all in archaeology. If ‘deformance’ is a key sign of the digital humanities, then digital archaeologists are not digital humanists. Owen’s point isn’t to signal who’s in or who’s out, but rather to draw attention to the fact that:

When we separate out the the context of discovery and exploration from the context of justification we end up clarifying the terms of our conversation. There is a huge difference between “here is an interesting way of thinking about this” and “This evidence supports this claim.”

This is important in the wider conversation concerning how we evaluate digital scholarship. We’ve used computers in archaeology for decades to try to justify or otherwise connect our leaps of logic and faith, spanning the gap between our data and the stories we’d like to tell. A digital archaeology that sat within the digital humanities would worry less about hypothesis testing, and concentrate more on discovery and generation, of ‘interesting way[s] of thinking about this’.

1.1.2 Archaeological Glitch Art

Bill Caraher is a leading thinker on the implications and practice of digital archaeology. In a post on archaeological glitch art (Caraher 2012) Caraher changed file extensions to fiddle about in the insides of images of archaeological maps. He then looked at them again as images:

The idea ... is to combine computer code and human codes to transform our computer mediated image of archaeological reality in unpredictable ways. The process is remarkably similar to analyzing the site via the GIS where we take the “natural” landscape and transform it into a series of symbols, lines, and text. By manipulating the code that produces these images in both random and patterned ways, we manipulate the meaning of the image and the way in which these images communicate information to the viewer. We problematize the process and manifestation of mediating between the experienced landscape and its representation as archaeological data.

Similarly, Graham’s work in representing archaeological data in sound (a literal auditory metaphor) translates movement over space (or through time) into a soundscape of tones (Graham 2017). This frees us from the tyranny of the screen and visual modes of knowing that often occlude more than they reveal (for instance, our Western-framed understanding of the top of the page or screen as ‘north’ means we privilege visual patterns in the vertical dimension over the horizontal (Montello et al. 2003)).

1.1.3 The ‘cool’ factor

Alan Liu (Liu 2004) wondered what the role of the arts and humanities was in an age of knowledge work, of deliverables, of an historical event horizon that only goes back the last financial quarter. He examined the idea of ‘knowledge work’ and teased out how much of the driving force behind it is in pursuit of the ‘cool’. Through a deft plumbing of the history of the early internet (and in particular, riffing on Netscape’s ‘what’s cool?’ page from 1996 and their inability to define it except to say that they’d know it when they saw it), Liu argues that cool is ‘the aporia of information. . . cool is information designed to resist information [emphasis original]. . . information fed back into its own signal to create a standing interference pattern, a paradox pattern’ (Liu 2004, 179). The latest web design, the latest app, the latest R package for statistics, the latest acronym on Twitter where all the digital humanists play: cool, and dividing the world.

That is, Liu argued that ‘cool’ was amongst other things a politics of knowledge work, a practice and ethos. He wondered how we might ‘challenge knowledge work to open a space, as yet culturally sterile (coopted, jejune, anarchistic, terroristic), for a more humane hack of contemporary knowledge?’ (Liu 2004, 9). Liu goes on to discuss how the tensions of ‘cool’ in knowledge work (for us, read: digital archaeology) also intersects with an ethos of the unknown, that is, of knowledge workers who work nowhere else somehow manage to stand outside that system of knowledge production. (Is alt-ac ‘alt’ partially because it is the cool work?). This matters for us as archaeologists. There are many ‘cool’ things happening in digital archaeology that somehow do not penetrate into the mainstream (such as it is). The utilitarian dots-on-a-map were once cool, but are now pedestrian. The ‘cool’ things that could be, linger on the fringes. If they did not, they wouldn’t be cool, one supposes. They resist.

To get that more humane hack that Liu seeks, Liu suggests that the historical depth that the humanities provides counters the shallowness of cool:

The humanities thus have an explanation for the new arts of the information age, whose inheritance of a frantic sequence of artistic modernisms, postmodernisms, and post-postmodernists is otherwise only a displaced encounter with the raw process of historicity. Inversely, the arts offer the humanities serious ways of engaging – both practically and theoretically- with “cool”. Together, the humanities and arts might be able to offer a persuasive argument for the humane arts in the age of knowledge work. (Liu 2004, 381).

In which case, the emergence of digital archaeologists and historians in the last decade might be the loci of the humane hacks – if we move into that space where we engage the arts. Indeed, the seminal anthropologist Tim Ingold makes this very argument with reference to his own arc as a scholar, ‘From Science to Art and Back Again’:

Revisiting science and art: which is more ecological now? Why is art leading the way in promoting radical ecological awareness? The goals of today’s science are modelling, prediction and control. Is that why we turn to art to rediscover the humility that science has lost?

We need to be making art. Digital archaeology naturally pushes in that direction.

1.1.4 Takeaways

- Digital archaeology is a public archaeology
- Digital archaeology is more often about deformation rather than justification
- In that deformative practice, it is in some ways extremely aligned with artistic ways of knowing
- Digital archaeology is part of the digital humanities, and in many ways, presaged current debates and trends in that field.

All of these aspects of digital archaeology exist along a continuum. In the remainder of this chapter, we discuss the necessary skills to get you to the point where you can begin to wonder about deformation and the public entanglement with your work.

1.2 Project management basics

A digital project, whether in archaeology or in other fields, iterates through the same basic steps. There is 1. finding data 2. fixing data 3. analyzing the data 4. communicating the story in the data

Eighty percent of your time on any digital project will be invested in cleaning up the data and documenting what you've done to it. But in truth, a digital project begins long before we ever look at a data set (or are given data to work with, if we're part of a larger project). How do we formulate a research question or our exploration more generally? How do we translate a gut feeling or intuition or curiosity into something that is *operable*? REF Moretti on operationalizing things

Firstly, we have to develop some basic good habits. 1. separate what you write from *how* you write it. 2. keep what you write under version control.

Have you ever fought with Word or another wordprocessor, trying to get things just right? Word processing is a mess. It conflates writing with typesetting and layout. Sometimes, you just want to get the words out. Othertimes, you want to make your writing as accessible as possible... but your intended recipient can't open your file, because they don't use the same wordprocessor. Or perhaps you wrote up some great notes that you'd love to have in a slideshow; but you can't, because copying and pasting preserves a whole lot of extra gunk that messes up your materials.

The answer is to separate your content from your tool. This can help keep your thinking clear, but it also has a more nuts-and-bolts practical dimension. *A computer will always be able to read a text file.* That is to say: you've futureproofed your material. Any researcher will have old physical discs or disc drives or obsolete computers lying around. It is not uncommon for a colleague to remark, 'I wrote this in Wordperfect and I can't open this any more'. Graham's MA thesis is trapped on a 3.5" disc drive that was compressed using a now-obsolete algorithm and it cannot be recovered. If, on the other hand, he had written the text as a .txt file, and saved the data as .csv tables, those materials would *continue* to be accessible.

(a .txt file is simply a text file; a .csv is a text file that uses commas to separate the text into columns. Similarly, a .md file is a text file that uses things like # to indicate headers, and _ to show where italicized text starts and stops.)

As you work through this book, we encourage you to write your thoughts, observations, or results in simple text files. You can always open a text file in the latest version of Word; sometimes, you can't open old Word files in the latest version of Word! We will discuss more about this below, where we will have you do some exercises in marking up a text file with 'markdown'.

The four steps we identified above are cyclical; at any one time you might be at a different stage of the process. Indeed, those four steps could easily be subsumed under what Simon Appleford and Jennifer Guiliano of devdh.org identify as the 'Best Practice Principles Of Designing Your First Project.' For Appleford and Guiliano, the outline of a project involves figuring out:

1. the question, problem, or provocation
2. sources (primary, secondary)
3. analytical activity
4. audience
5. product

Note that 4, audience, comes before 5, product. You must think of your reader/user!

Let us imagine that we were inspired by Allison Mickel's piece, 'Tracing Teams, Texts, and Topics: Applying Social Network Analysis to Understand Archaeological Knowledge Production at Çatalhöyük'.

We could frame a question: 'What role do social networks play in the development of knowledge production at my site?'

We could frame a problem: 'Mickel's exploration of social networks considered x, but not y.'

We could frame a provocation: ‘Social Network Analysis promises to revolutionize our knowledge of the social contexts that underpin archaeological fieldwork, putting this power in the hands of everyone from the site director on down.’

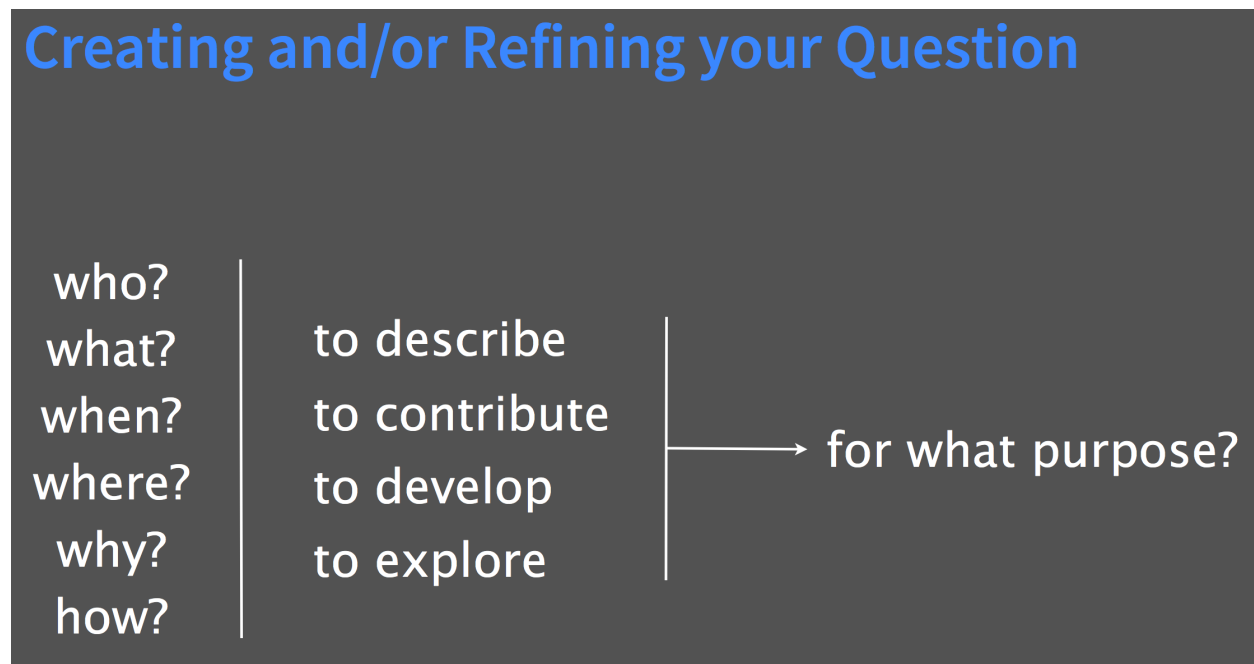

Figure 1.1: Creating and/or refining your research question

Following Appleford and Guiliano, we can refine our question, or our problem, or our provocation down to its essence in order to figure out the next parts of the the process. Knowing exactly what kind of question, problem, or provocation we’re after, we then have a better sense of what to do when confronted with a mass of data (for instance, the excavation diaries from Kenen Tepe held in OpenContext.org, deposited by Parker and Cobb, 2012). Once the question is well-drawn out, questions 3 and 4 take care of themselves.

One other element that we might add is ‘collaboration’. How do you plan to collaborate? While many digital archaeology projects are done by a single individual working in the quiet of their own space, most projects require many different skill sets, perspectives, and stakeholders. It is worth figuring out at the outset how you plan to work together. Will you use email? Will you use a private slack or messaging client? What about Kanban boards? (A Kanban board can be as simple as a whiteboard with three columns on it, marked ‘to do’, ‘doing’, and ‘done’. Tasks are written on post-it notes and moved through the columns as necessary. A popular software implementation of a Kanban board is Trello.) We would also recommend that you write down the ideal division of labour and areas of responsibility for each of the participants, *along with a mechanism for resolving disputes*.

Finally, how much time would you have to work on your digital archaeology project? All of us have multiple demands on our time. Let’s be realistic about how much time you have available. How many hours, total, do you spend in class, at work, asleep, and socializing? Add that up for a week, then multiply by the number of weeks in your term. There are 384 hours in a 16 week term. Subtract to find out how many ‘spare’ hours you can devote to homework, this project, or a hobby.

Divide that by the number of weeks your course runs. That’s how many hours per week you can spend on all your non in-class course work.

2. Divide those hours by the number of courses you have.

Assuming that this textbook is being used for one of those courses, that’s how much time you would have to spend on a digital archaeology project. It’s not an awful lot, which means that the more energy you put into

planning, the more effective your labour is going to be.

1.2.1 exercises

1. (to be refined) Open a new textfile in the Archaeobox. Call it ‘initial-project-idea.md’. Using # to indicate headings, sketch out a question, problem, or provocation of your own that occurs to you as you browse the Kenen Tepe materials housed at OpenContext.org. Save that file.
2. create a project management plan.
